

The hierarchy of controls is a set of practices adopted by Clean Air Metals Inc. to protect workers from exposure. The controls are considered, in order, from most effective and protective to the least effective and protective.

1. Elimination or substitution: Remove or change substances or processes that could be harmful.
2. Engineering: Design the work area to reduce exposure to hazards (for example, install ventilation or barriers).
3. Administrative controls: Provide training and supervision on how to avoid exposure to hazards and limit exposures through work scheduling and breaks.
4. Personal protective equipment: Have workers wear protective gear, such as respirators to prevent them from breathing in hazardous substances.
